Aging and Technology: How Do We Know What Works?

Brain training. Smart homes. Robots. Wearables. Monitoring and reminder systems. Personal digital assistants. Self-driving cars. Will these things actually prove to be useful and practical for the health and well-being of older adults?

Wendy Rogers, Professor of Psychology, directs the Human Factors and Aging Laboratory at the Georgia Institute of Technology. Research areas include healthcare technologies; design for aging; technology acceptance; human-automation interaction; aging-in-place; human-robot interaction; cognitive aging; aging with disabilities; and skill acquisition and training. She is a member of the Aware Home Research Initiative aimed at addressing the fundamental technical, design, and social challenges for people in a home setting. Central to this research is the Aware Home, a 3-story, 5040 square foot facility designed for research while providing an authentic home environment.
